extra

- sudo apt remove --purge apache.

1. docker

It connects us to a server having different conatiners (number depend on your need) and each of these containers emulates a seperate system.suppose for a project you want 12 versions of tensorflow, you can't do that with your system(it can only have one active version),but in docker you can use 12 different containers with 12 different tensorflow version.

2. How to get only the name of file without extension using pathlib

```
import pathilb
path = c:/project/Linux/codes/night.txt

name = pathlib.path(path).stem

>>> night
```
